I would love to help you !

Phoenix Expert Advisor

Phoenix Forex expert advisor is a very complicated EA. It uses many standard MetaTrader 4 indicators (like moving averages and envelopes) to determine the position entry and exit points as well as position parameters. This expert advisor has many input parameters and internally stored data sets for each of the five currency pairs it can be used to trade with. The abundance of the indicators and conditional checks make Phoenix expert advisor a little slower for CPU to process.

My test of the **Phoenix MetaTrader expert advisor** resulted in about \$6,400 profit using GBP/USD pair on a fifteen minute timeframe using 1 standard lot to open positions. Testing was done over a one year period, with maximum drawdown as little as \$96. I've also checked it on a three years period and it showed the same performance.

MiniFAQ

What are the stop-loss and take-profit used by this EA?

It uses the variable stop-loss and take-profit values, but the average winning and losing position yield 138 and 148 pips on average respectively.

How often does it trade?

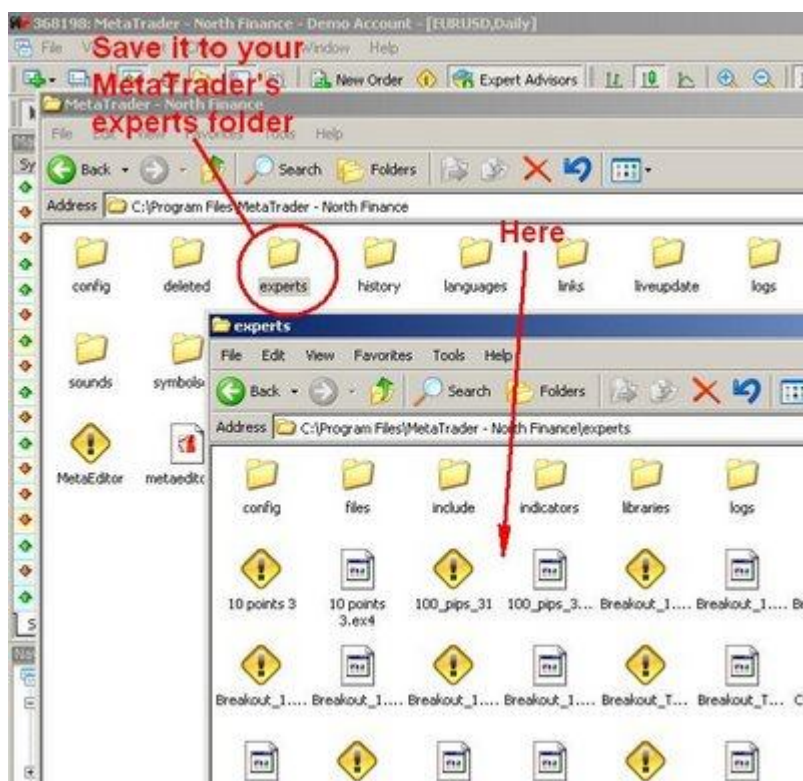

On 15-minute GBP/USD chart (the optimum settings) this EA will trade 1 time a day on average.

Metatrader Expert Advisors — User's Tutorial

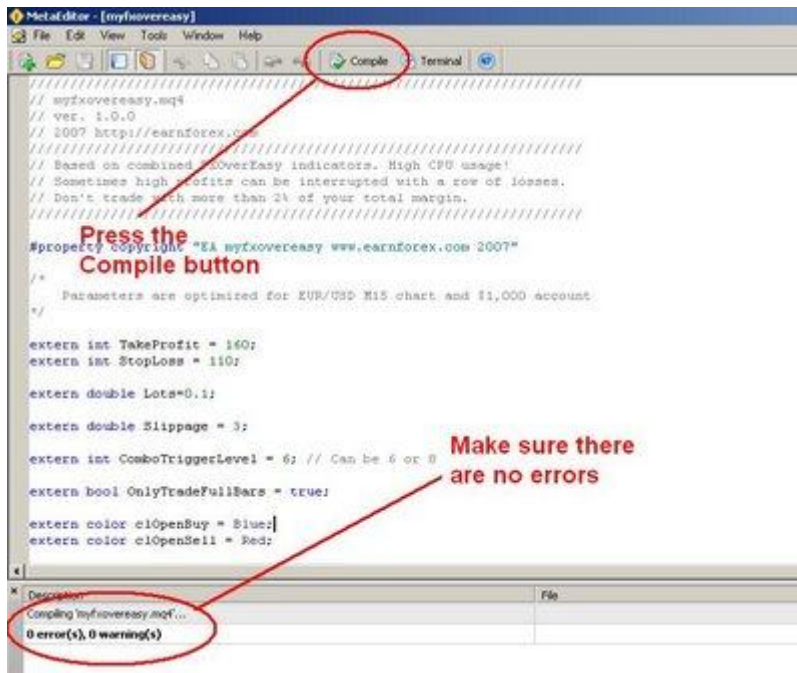

Using Metatrader expert advisors is simple, but sometimes people get confused with it and after downloading a file with the expert advisor a user might get stuck with it without knowing what to do next. This a simple tutorial on how to attach an expert advisor to Metatrader 4 char and activate it.

1. Download your MT4 expert advisor or copy it and save it to your MetaTrader's 'experts' folder:

2. Double click it with your mouse and it will be opened in MQL editor (this editor comes with MT4). There will be a button 'Compile' at the center top of the window. Click it

and your expert advisor will be compiled and ready to use. There might be some errors or warnings during the compilation, but in most cases there shouldn't be any. You can try and fix those errors, but it takes time and some programming skills, usually.

3. Now, all you need to do is add your expert advisor to the preferred chart and activate it. You can also change some input parameters for the advisor in the Inputs tab:

That's it! Now you can enjoy your expert advisor. Good luck !
